

Keemia lahtise võistluse ülesannete lahendused

Vanem aste (11. ja 12. klass)

27. november 1999. a.

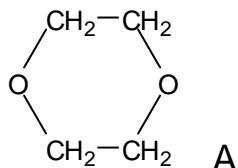

1. a)

$$\Delta T = K_{kr} \cdot m$$

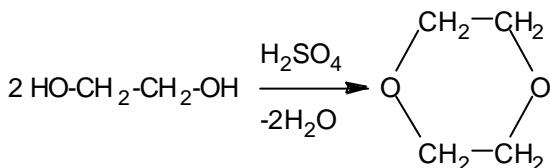

$$1,11K = 1,86 \frac{K}{mol} \cdot kg \cdot \frac{5g}{M(A)} \cdot \frac{1}{0,095kg}$$

$$M(A) = 1,86 \frac{K}{mol} \cdot kg \cdot 5g \cdot \frac{1}{0,095kg} \cdot \frac{1}{1,11K} = 88 \frac{g}{mol}$$

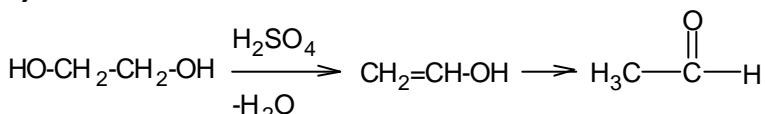

Kui molekulis on 2 hapniku, 4 süsiniku ja 8 vesiniku aatomit, siis see annab molaarmassiks 88 g/mol. Et aatomite vahel on ainult σ -sidemed, siis peab ta olema tsükliline ühend. Alkoholi ja väävelhappe vahelisel reaktsioonil tekib eeter.

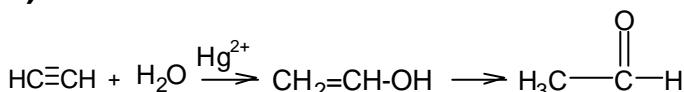

b)

c) i)

ii)

d) **B** – etaan-1,2-diool; **C** – etenool
D – etanaal; **E** – etüün

2. a) $M(\text{Na}) : M(\text{Li}) = 23,0 : 6,94 = 3,31$

X – Li; **Y** – Na

b) **C** – C_4H_{10} (butaan)
E – $\text{C}_4\text{H}_9\text{Cl}$ (butüülkloriid)
D – $\text{C}_4\text{H}_9\text{OH}$ (butanol)

c) $\text{C}_4\text{H}_9\text{Cl} + 2\text{Li} = \text{C}_4\text{H}_9\text{Li} + \text{LiCl}$
A – $\text{C}_4\text{H}_9\text{Li}$

d) $\text{C}_4\text{H}_9\text{Li} + \text{H}_2\text{O} = \text{C}_4\text{H}_{10} + \text{LiOH}$

e) $c(\text{C}_4\text{H}_9\text{Li}) = c(\text{LiOH}) = \frac{1}{1} \cdot 14,0\text{ml} \cdot 0,120 \frac{\text{mol}}{\text{dm}^3} \cdot \frac{1}{1\text{ml}} = 1,68 \frac{\text{mol}}{\text{dm}^3} = 1,68\text{M}$, sest

f) G – NH₃ (gaas)**F – NH₃ (vedelik t°_{keemis.} (NH₃) = -33,5°C)****B – NaNH₂****H – CH₃ONa****3. a) i) M(COCl₂) = 98,9 g/mol**

$$\mathbf{M(A) = 98,9 \cdot 0,273 = 27,0 \text{ g/mol}}$$

ii) HCN – vesiniktsüaniid

$$\mathbf{b) i) c(HCN) = 1,00 \text{ g} \cdot \frac{1 \text{ mol}}{27,0 \text{ g}} \cdot \frac{1}{0,1 \text{ dm}^3} = 0,370 \frac{\text{mol}}{\text{dm}^3}}$$

$$\mathbf{ii) [H^+] = 10^{-\text{pH}} = 10^{-4,77} = 1,70 \cdot 10^{-5} \text{ mol/dm}^3}$$

$$\mathbf{iii) a = \frac{[H^+]}{c} = \frac{1,70 \cdot 10^{-5}}{0,370} = 4,59 \cdot 10^{-5}}$$

$$\mathbf{K_{dis} = \frac{[H^+] \cdot [CN^-]}{[HCN]} = \frac{1,70 \cdot 10^{-5} \cdot 1,70 \cdot 10^{-5}}{0,370} = 7,81 \cdot 10^{-10}}$$

Märkus: et α on väga väike, siis $[HCN] \approx c(HCN)$

d) HCN Et dissotsiaatsioonil tekib vesinikioon ja tsüaniidioon, siis peab vesiniku oksüdatsiooniaste olema I. Kuna lämmastiku elektronegatiivsus on süsiniku omast suurem, siis saab lämmastiku oksüdatsiooniaste olla ainult -III. Süsiniku oksüdatsiooniastmeeks jäab II.

f) HCN ja COCl₂ on väga mürgised.

4. a) CO(NH₂)₂ - karbamiid; neutraalne; 0CN⁻ - tsüaniidioon; -1.

c) Karbamiidis on süsiniku oksüdatsiooniaste IV, sest karbamiid on süsihappe derivaat. Tsüaniidioonis peab süsiniku oksüdatsiooniaste olema II, sest lämmastik on süsinikust elektronegatiivsem.

d)	Mn(VII)	+ 4e ⁻ → Mn(III)	7 - 3 = 4	+ 4e ⁻
	4Cr(III)	-12e ⁻ → 4Cr(VI)	4·3 - 4·6 = -12	
	3Cr(II)	-12e ⁻ → 3Cr(VI)	3·2 - 3·6 = -12	
	4·6·2N(-III)	-384e ⁻ → 48N(V)	48·(-3) - 48·5 = -384	- 588e ⁻
	3·6N(-III)	-144e ⁻ → 18N(V)	18·(-3) - 18·5 = -144	
	3·6C(II)	-36e ⁻ → 18C(IV)	18·2 - 18·4 = -36	

e) 588 : 4 = 147

Korrutades kahega saame vastavalt:

5. a) Cu|CuSO₄||AgNO₃|Ag

c) E(Cu²⁺/Cu) = 0,337V + $\frac{0,059}{2} \text{V lg } 0,1 = 0,308 \text{V}$

E(Ag⁺/Ag) = 0,799V + 0,059V lg 0,05 = 0,722V

EMJ = E = 0,722V - 0,308V = 0,414V

d) E° = 0,799V - 0,337V = 0,462V

$$2 \cdot 96500 \frac{\text{A} \cdot \text{s}}{\text{mol}} \cdot 0,462 \text{V} = 8,314 \frac{\text{A} \cdot \text{s} \cdot \text{V}}{\text{K} \cdot \text{mol}} \cdot 298 \text{K} \cdot \ln K_t$$

$$\ln K_t = \frac{2 \cdot 96500 \cdot 0,462}{8,314 \cdot 298} = 35,98$$

$$K_t = e^{35,98} \approx 4,27 \cdot 10^{15}$$

$$K_t = \frac{[\text{Cu}^{2+}]}{[\text{Ag}^+]^2}$$

6. a)

$$\Delta H_{\text{tekke}}^\circ(\text{CO}_2) = -393 \frac{\text{kJ}}{\text{mol}}$$

$$\Delta H_{\text{tekke}}^\circ(\text{CO}_2) = \Delta H_{\text{põlem}}^\circ(\text{C})$$

$$\Delta H_{\text{põlem}}^\circ(\text{CO}) = -566 \frac{\text{kJ}}{2 \text{mol}} = -283 \frac{\text{kJ}}{\text{mol}}$$

$$\Delta H_{\text{tekke}}^\circ(\text{CO}) = \Delta H_{\text{põlem}}^\circ(\text{C}) - \Delta H_{\text{põlem}}^\circ(\text{CO}) = -393 \frac{\text{kJ}}{\text{mol}} - (-283 \frac{\text{kJ}}{\text{mol}}) = -110 \frac{\text{kJ}}{\text{mol}}$$

b) n(grafiit) = 1000g · $\frac{1 \text{mol}}{12,0 \text{g}} = 83,33 \text{mol}$

$$n(\text{CO}) \cdot 28 \frac{\text{g}}{\text{mol}} = 4 \cdot [83,33 \text{mol} - n(\text{CO})] \cdot 44,0 \frac{\text{g}}{\text{mol}}, \text{ sest CO mass on 4 korda CO}_2$$

massist suurem.

$$n(\text{CO}) = 71,9 \text{mol}$$

$$n(\text{CO}_2) = 11,4 \text{mol}$$

$$\mathbf{c)} V_m = 22,4 \frac{\text{dm}^3}{\text{mol}} \cdot \frac{298\text{K}}{273\text{K}} = 24,45 \frac{\text{dm}^3}{\text{mol}}$$

$$V(\text{CO}) = 71,9\text{mol} \cdot 24,45 \frac{\text{dm}^3}{\text{mol}} \approx 1760\text{dm}^3$$

$$V(\text{CO}_2) = 11,4\text{mol} \cdot 24,45 \frac{\text{dm}^3}{\text{mol}} \approx 279\text{dm}^3$$

$$\mathbf{d)} \Delta H^\circ = 71,9\text{mol} \cdot (-110) \frac{\text{kJ}}{\text{mol}} + 11,4\text{mol} \cdot (-393) \frac{\text{kJ}}{\text{mol}} = -7909\text{kJ} - 4480\text{kJ} \approx \mathbf{-12,4\text{MJ}}$$
