# $11^{\text {th }}$ BALTIC CHEMISTRY OLYMPIAD 

RIGA, APRIL 25-27, 2003
SOLUTIONS

## PROBLEM 1

Percentage of space occupied by spheres in the fcc arrangement:
$\left(4 \cdot 4 / 3 \cdot \pi r^{3}\right) /\left(4 \cdot r /\left(2^{1 / 2}\right)\right)^{3}=\pi /\left(3 \cdot\left(2^{1 / 2}\right)\right)=0.740$
Total volume of the layer formed by 1 mol of peas:
$\mathrm{V}=\left(6,02 \cdot 10^{23} \cdot 4 / 3 \cdot \pi \mathrm{r}^{3}\right) / 0,740=9.20 \cdot 10^{16} \mathrm{~m}^{3}$
$V=4 / 3 \pi\left(R_{2}{ }^{3}-R_{1}{ }^{3}\right)$,
where $R_{2}$ - the outer radius of the layer of peas,
$R_{1}$ - the inner radius of the layer of peas.
The inner radius $R_{1}$ can be calculated from the surface of the Earth:
$R_{1}=(S /(4 \pi))^{1 / 2}=6.370597 \cdot 10^{6} \mathrm{~m}$.
$\mathrm{R}_{2}=\left(\left(\mathrm{V}+4 / 3 \pi \mathrm{R}_{1}{ }^{3}\right) /(4 / 3 \pi)\right)^{1 / 3}=6.370777 \cdot 10^{6} \mathrm{~m}$.
The thickness of the layer $d=R_{2}-R_{1}=180 \mathrm{~m}$.
The correct answer is $\mathbf{b}$.
Lupine would fit into the octahedral holes, which can accommodate particles with the diameter up to $0.414 \cdot 6=2.5 \mathrm{~mm}$.

## PROBLEM 2

i)

ii) structures $\mathbf{A}$ and $\mathbf{B}$
iii) angle $\mathrm{H}-\mathrm{N}-\mathrm{N}$ between $120^{\circ}$ and $109^{\circ}$ angle $\mathrm{N}-\mathrm{N}-\mathrm{N} \quad 180^{\circ}$
iv)

v) $\Delta H_{f}{ }^{\circ}=622+2(-285,8)=50,4 \mathrm{~kJ} / \mathrm{mol}$

## Actual structure

## PROBLEM 3

a) $n\left({ }_{2}^{4} \mathrm{He}\right)=(226-206) \cdot 4=5$
$n(\beta)=5 \cdot 2-(88-82)=4$
b) $\mathrm{v}=\mathrm{k} \cdot \mathrm{c} ; \tau=\frac{\ln 2}{\mathrm{k}}$
$\mathrm{v}_{1}=\mathrm{v}_{2}$
$\mathrm{k}_{1} \cdot \mathrm{c}_{1}=\mathrm{k}_{2} \cdot \mathrm{c}_{2}$
$\frac{\mathrm{k}_{2}}{\mathrm{k}_{1}}=\frac{\mathrm{c}_{1}}{\mathrm{c}_{2}}$
$\frac{\tau_{1}}{\tau_{2}}=\frac{\mathrm{k}_{2}}{\mathrm{k}_{1}}=\frac{\mathrm{c}_{1}}{\mathrm{c}_{2}} \Leftrightarrow \frac{\mathrm{n}_{1}}{\mathrm{n}_{2}}$
c) $\mathrm{c} \Leftrightarrow \mathrm{n}$
$\mathrm{n}=\frac{\mathrm{m}}{\mathrm{M}}$
$\frac{1580 \text { year } \cdot 365,25 \text { day } / \text { year }}{138,8 \text { day }}=\frac{\mathrm{m}(\mathrm{Ra})}{226 \mathrm{~g} / \mathrm{mol}} \cdot \frac{210 \mathrm{~g} / \mathrm{mol}}{10^{-3} \mathrm{~g}}$
$m(R a)=\frac{1580 \text { year } \cdot 365,25 \text { day } / \text { year }}{138,8 \text { day }} \cdot \frac{10^{-3} \mathrm{~g}}{210 \mathrm{~g} / \mathrm{mol}} \cdot 226 \mathrm{~g} / \mathrm{mol}=4,47 \mathrm{~g}$
m (ore) $=4,47 \mathrm{~g} \cdot \frac{1 \mathrm{t}}{0,14 \mathrm{~g}}=31,9 \mathrm{t} \approx 32 \mathrm{t}$
d) ${ }_{88}^{226} \mathrm{Ra}={ }_{84}^{210} \mathrm{Po}+4 \alpha+4 \beta$
$\Delta \mathrm{m}=4 \cdot 0,00055 \mathrm{u}+4 \cdot 4,00273 u+209,98286 u-226,0254 u=-0,02942 u$
e) $\Delta \mathrm{m}=\frac{10^{-3} \mathrm{~g}}{210 \mathrm{~g} / \mathrm{mol}}-0,02942 \mathrm{u} \cdot 1 \mathrm{~g} / \mathrm{mol} \cdot \mathrm{u}=-1,40 \cdot 10^{-7} \mathrm{~g}$

$$
\Delta E=-1,40 \cdot 10^{-10} \mathrm{~kg} \cdot 9,0 \cdot 10^{16} \mathrm{~m}^{2} / \mathrm{s}^{2}=-1,26 \cdot 10^{7} \mathrm{~J}=-1,26 \cdot 10^{4} \mathrm{~kJ} \approx-1,3 \cdot 10^{4} \mathrm{~kJ}
$$

## PROBLEM 4

a) For the reaction (1) $\quad E_{1}=E^{o}\left(A g^{+} / A g\right)+\frac{R T}{F} \cdot \ln c\left(A g^{+}\right)$

For the reaction (2) $\quad E_{2}=E^{o}\left(I^{-} / A g I / A g\right)-\frac{R T}{F} \cdot \ln c\left(I^{-}\right)$
The equilibria are established on the same electrode, therefore $\mathrm{E}_{1}=\mathrm{E}_{2}$

$$
E^{o}\left(A g^{+} / A g\right)-E^{o}\left(I^{-} / A g I / A g\right)=-\frac{R T}{F} \ln \left[c\left(A g^{+}\right) \cdot c\left(J^{-}\right)\right]
$$

The solubility product $\mathrm{L}=\mathrm{c}\left(\mathrm{Ag}^{+}\right) \cdot \mathrm{c}(\mathrm{\Gamma})$

$$
\log L=\frac{-0,152-0,799}{0,0591}=-16,091 \quad \mathrm{~L}=\mathbf{8 , 1 3} \cdot \mathbf{1 0}^{-\mathbf{1 7}}
$$

b) $\mathrm{Ag}(\mathrm{s})+\mathrm{H}^{+}(\mathrm{sol}) \Leftrightarrow \mathrm{Ag}+(\mathrm{sol})+0.5 \mathrm{H}_{2}(\mathrm{~g})$ (3)

$$
\begin{aligned}
& 0,799+0,0591 \cdot \operatorname{lg~c}\left(\mathrm{Ag}^{+}\right)=0+0,0591 \cdot \lg 1 \\
& \lg \mathrm{c}\left(\mathrm{Ag}^{+}\right)=\frac{-0,799}{0,0591}=-13,52 \\
& \mathrm{c}(\mathrm{Ag}+)=10^{-13.52} \mathrm{~mol} / \mathrm{dm}^{3}
\end{aligned}
$$

As the product of ions concentration in solution $c\left(\mathrm{Ag}^{+}\right) \cdot \mathrm{c}(\mathrm{I})=10^{-13.52} \cdot 1$ is remarkably higher than the solubility product $8.13 \cdot 10^{-17}$, the AgI is precipitated, shifting the equilibrium from left to right. Thus, thermodynamically both the dissolution of silver and the evolution of hydrogen are possible.
c) The reaction (3) is hindered by the formation of passivating Agl film and polarization phenomenon due to the $\mathrm{H}_{2}$ evolution.

## PROBLEM 5

1. Amount of selenious acid $n=m / M=1.29 / 129=0.01 \mathrm{~mol}$
2. Concentration of solution: $\mathrm{c}_{0}=\mathrm{n} / \mathrm{v}=0.01 / 0.1=0.1 \mathrm{~mol} / \mathrm{l}$
3. Amount of NaOH in each portion ( 5 ml ): $\mathrm{n}=\mathrm{c} . \mathrm{v}=0.005^{*} 1=0.005 \mathrm{~mol}$
4. pH values are determined by protolytic equilibrium in water solution. Different protolytic systems created from selenious acid and hydroxide ions should be analyzed solving this problem. Formulas for calculation of pH in different protolytic systems may be memorized or derived from corresponding chemical equilibria.

| No. | Total volume of NaOH added, mL | Equation of reaction | Formula for calculation of pH (see for comments below) | Calculated pH value |
| :---: | :---: | :---: | :---: | :---: |
| 1. | 0 | $\begin{aligned} & \mathrm{H}_{2} \mathrm{SeO}_{3}+\mathrm{H}_{2} \mathrm{O}= \\ & \mathrm{HSeO}_{3}^{-}+\mathrm{H}_{3} \mathrm{O}^{+} \end{aligned}$ | (weak acid in water) $\mathrm{pH}=1 / 2\left(\mathrm{pK}_{1}-\lg \mathrm{c}_{\mathrm{A}}\right)$ | 1.81 |
| 2. | 5.00 | $\begin{aligned} & \mathrm{H}_{2} \mathrm{SeO}_{3}+\mathrm{OH}^{-} \rightarrow \\ & \mathrm{HSeO}_{3}^{-}+\mathrm{H}_{2} \mathrm{O} \end{aligned}$ | (buffer system) $\mathrm{pH}=\mathrm{pK}_{1}+\lg \left(\mathrm{c}_{\mathrm{B}} / \mathrm{c}_{\mathrm{A}}\right)$ | 2.62 |
| 3. | 10.00 | $\begin{aligned} & \mathrm{H}_{2} \mathrm{SeO}_{3}+\mathrm{OH}^{-} \rightarrow \\ & \mathrm{HSeO}_{3}^{-}+\mathrm{H}_{2} \mathrm{O} \end{aligned}$ | (amphyprotic substance) $\mathrm{pH}=1 / 2\left(\mathrm{pK}_{1}+\mathrm{pK}_{2}\right)$ | 5.47 |
| 4. | 15.00 | $\begin{aligned} & \mathrm{HSeO}_{3}^{-}+\stackrel{+}{\mathrm{H}_{2}^{-}} \rightarrow \\ & \mathrm{SeO}_{3}^{2-}+\stackrel{ }{+} \end{aligned}$ | (buffer system) $\mathrm{pH}=\mathrm{pK}_{2}+\lg \left(\mathrm{c}_{\mathrm{B}} / \mathrm{c}_{\mathrm{A}}\right)$ | 8.32 |
| 5. | 20.00 | $\begin{aligned} & \mathrm{HSeO}_{3}^{-}+\mathrm{OH}^{-} \rightarrow \\ & \mathrm{SeO}_{3}^{2-}+\mathrm{H}_{2} \mathrm{O} \end{aligned}$ | (weak base) $\mathrm{pH}=1 / 2\left(14+\mathrm{pK}_{2}+\lg \mathrm{c}_{\mathrm{B}}\right)$ | 10.66 |
| 6. | 25.00 | $\mathrm{OH}^{-}$(excess) | (strong base) <br> $\mathrm{pH}=14+\lg \mathrm{C}_{\mathrm{B}}$ | 12.70 |

## Comments.

1. Concentration of protolytes determining pH values $(\mathrm{mol} / \mathrm{I})$ : 1) $\mathrm{H}_{2} \mathrm{SeO}_{3} 0.1$; 2) $\mathrm{H}_{2} \mathrm{SeO}_{3}$ $0.05, \mathrm{HSeO}_{3}{ }^{-} 0.05$; 3) $\mathrm{HSeO}_{3}{ }^{-} 0.1$; 4) $\mathrm{HSeO}_{3}{ }^{-} 0.05, \mathrm{SeO}_{3}{ }^{2-} 0.05$; 5) $\mathrm{SeO}_{3}{ }^{2-} 0.1$; 6) excess of $\mathrm{OH}^{-} 0.05$.
2. If changes in solution volume was taken in consideration, calculated pH values are slightly different.

## PROBLEM 6

The reaction schemes indicated $a-e$ are as follows:

B

Oxidation of tropinone leads to ring reopening.
Reduction of tropinone gives two isomeric alcohols, namely tropine and pseudotropine, which differ in exo- or endo-position of hydroxyl group. The first is converted to tropine under basic conditions.

Sythesis of tropinone from hygrine is shown in the last sheme. Oxidation leads to hydrogen abstraction with subsequent enolization of ketone and the following cyclization.
